	Paper Title:	Vascularization and Adipogenesis of a Spindle Hierarchical Adipose-Derived Stem Cell/Collagen/Alginate-PLGA Construct for Breast Manufacturing	
1.	<p>Abstract: The creation of vascularized adipose tissues is a subject of broad fundamental and technological interest in implantable breast manufacturing. Here, we demonstrated a simple, easy, and effective way to fabricate a spindle hierarchical poly(DL-lactic-co-glycolic acid) (PLGA) encapsulated adipose-derived stem cell (ADSC)/collagen/alginate construct with a multiple-branched vascular network using a rotational combined mould system (RCMS). Both the optimized PLGA overcoat and internal collagen/alginate hydrogel provided the ADSCs with a stable and comfortable accommodation to grow, proliferate, and differentiate. Cell viability remained at a comparatively high level during 4 weeks in vitro engagement with two groups of cell growth factor combinations. At the end of the second week, part of the cells were engaged into endothelial cells, while at the end of the fourth week more than 63% of the ADSCs were replaced by adipose cells. We envisage that this RCMS, vascularization and adipogenesis techniques will provide an enabling platform for a wide array of research and clinical applications.</p> <p>Keywords: Vascularization; adipogenesis; a rotational combined mould system; adipose-derived stem cells (ADSCs); collagen/alginate hydrogel</p> <p>References:</p> <ol style="list-style-type: none"> Cui T, Yan Y, Zhang R, Xu M, & Wang X. Paper Title: Design of Low Power Optimized Filter Architecture using VLSI Technique

Abstract: In the prevalence of DSP applications the weighted operations are the multiplication and accumulation. Multiplier-Accumulator (MAC) unit that consumes low power is always a means to accomplish a high concert digital signal processing system. Finite impulse response (FIR) filters are widely used in various DSP applications where signal were present with noise (e.g. data converters). Uptill many proficient techniques have been introduced for the design of low snag bit-parallel multiple constant multiplications (MCM) process which reduces the intricacy of many digital signal processing systems. On the other hand, digit-serial adder architectures present remarkable n-bit designs which process dynamic size data, since digit-serial operators hold less area and power. The purpose of this work is to design and implementation of low power optimized digital Finite impulse response (FIR) filter architecture using VLSI technique. We design and analyze 1] Direct form 2] Transpose form 3] Transpose using MCM 4] Transpose using digit serial adder 5] Transpose using MCM and digit serial adder. Experimental results shows the efficiency of the various architectures and we found best performance results of Transpose using MCM and digit serial adder design in terms of area and power. To execute this work the design is verified using Active-HDL with MATLAB and synthesis [45nm] using Synopsys.

Keywords: digit- serial adder architecture, FIR, Low Power, MAC, MCM.

Paper Title: Campus Access Management System via RFID

Abstract: For colleges where security is vital and access to certain areas of campus must be controlled & monitored, there should be some access control system that allows college administration to manage and monitor all access points & locks centrally and remotely, allowing for auditable security & quick responses to any security breaches. Campus Access Management System (CAMS) via Radio-Frequency Identification (RFID) allows only authorized persons i.e. student, teacher or an employee to enter a particular area of the college campus. The authorized persons are provided with unique RFID Tag & its PIN code, using which they can access that area. The system is designed using Peripheral Interface Controller (PIC) Microcontroller MICROCHIP-16F877 and comprises of RFID module

	<p>(Tag+Reader), Keypad for entering access code an (Liquid Crystal Display) LCD module for displaying “name” of the authorized person & a relay for opening the door for him. For an unauthorized person door remains closed and buzzer alarms with indication as “invalid card” on LCD Display [1]. The data from RFID reader is transmitted to a Centralized Remote Computer or Server located in the administrative office of the college through a RS-232 interface. The centralized server determines the authorization & access control rights.
